

# 3D vs. 2D PET

The main advantage of the 3-D acquisition in PET is an improved sensitivity of ~5-7 times the 2-D sensitivity.

The drawback is that the scatter fraction increases by a factor of 3.

Non-uniform axial sensitivity

Higher Randoms Rates → Increased Noise

Dead-time problems

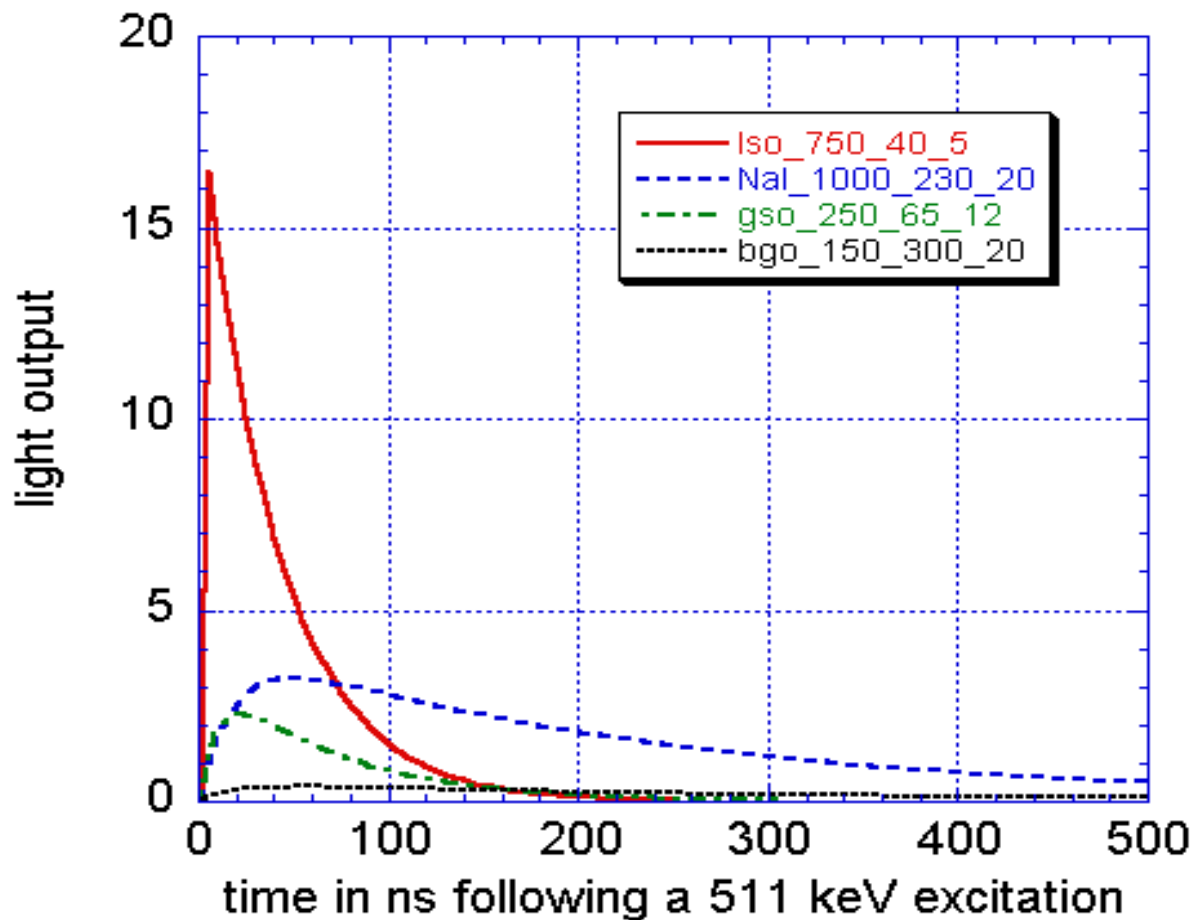

Image reconstruction is more complex

More data

# Time-of-flight PET

$$R + x = vt_1$$

$$R - x = vt_2$$

$$2x = v(t_2 - t_1) \Rightarrow x = \frac{c\Delta t}{2}$$

# Time-of-flight PET

For ideal detectors, TOF would eliminate the need for image reconstruction, since the measurement would allow each event to be accurately positioned in space.

All detectors have a finite time resolution, or uncertainty in timing. This translates to an uncertainty in positioning.

BGO ~ 5 ns	75 cm
NaI ~ 1.5 ns	22.5 cm
CsF, LaBr <sub>3</sub> ~ 0.45 ns	6.7 cm
BaF <sub>2</sub> , LSO, LYSO ~ 0.3 ns	4.5 cm

# Time-of-flight PET

**Figure 1.** Image elements contributing to a LOR, for conventional PET (left) and TOF PET (right).

# Time-of-flight PET

Even with a finite time resolution, using the TOF information an improvement in signal-to-noise ratio (S/N) can be achieved:

$$SNR_{TOF} \cong \sqrt{\frac{D}{\Delta x}} SNR_{conv.} = \sqrt{\frac{2D}{c\Delta t}} SNR_{conv.}$$

# Time-of-flight PET – 1980's

## Problems with TOF in the 80's

Poor detection efficiency of available scintillators

TOF Gain did not offset the poor efficiency

To improve the efficiency, large detector modules were used

A more significant gain in S/N could be achieved by using high resolution detectors and conventional detection methods (Phelps, Hoffman, Huang, 1982).

# Time-of-flight PET today

## Scintillators:

CsF, BaF<sub>2</sub> → LSO, LYSO - *fast, high light, and dense*

## Detectors/PMTs:

1:1 coupling → 100:1 crystal encoding - *spatial resolution*

## Geometry:

2D (septa) → 3D with large axial FOV - *sensitivity*

## Reconstruction:

Analytic (FBP) → iterative (list-mode) - *system modeling*

## Electronics:

Accurate and stable

# Can we see TOF improvement?

6-to-1 contrast; 35-cm phantom

J. Karp, U of Penn

Noticeable improvement with TOF with large size phantom

# Gemini TF - patient study

Rectal carcinoma, metastases in mesentery and bilateral iliac chains

114 kg; BMI = 38.1  
12 mCi; 2 hr post-inj  
3min/bed
