

# COLLECTION OF FORMULAS

## in the course *Nuclide Technique 2p*

### Formula, diagrams and data

#### INTERNAL DOSIMETRY

$$1 \text{ eV} = 1.60207 \cdot 10^{-19} \text{ J} \quad (1)$$

$$D_{int} \text{ (Gy)} = 1.6 \cdot 10^{-13} \cdot n \cdot \bar{E}_\beta / m \quad (2)$$

$$dH/dt = 1.6 \cdot 10^{-13} \cdot W_R \cdot n/h \cdot \bar{E}_\beta / m \quad (3)$$

$dH/dt$  is the dose equivalent rate in Sv/h  
 $W_R$  the weight factor for radiation quality  
 $n/h$  is the number of absorbed particles per hour  
 $\bar{E}_\beta$  is the mean energy in MeV per  $\beta$  particle  
 $m$  is the mass unit in kg.

Equation (3) is here formulated for  $\beta$ -particles but is of course also true for other charged particles that can be regarded to deposit their energy locally. A more general formulation is: The radioactive decay emits particles of different types  $i = 1, 2, 3 \dots$ . The mean energy of particle type  $i$  emitted per decay is then

$$\Delta_i = k n_i \bar{E}_i \quad (4)$$

$k$  is a unit dependant constant  
 $n_i$  is the mean number of particle  $i$  per decay  
 $\bar{E}_i$  is the mean energy of particle  $i$  per decay

$\Delta_i$  has the dimension energy (J). Usually it is given as  $(\text{kg} \cdot \text{Gy}) / (\text{Bq} \cdot \text{h})$ . The time-integral of the radioactivity concentration in the organ,  $\int A(t) dt$  has the dimension  $\text{Bq/kg} \cdot \text{h}$ . If we multiply the time integral with  $\Delta_i$  we get absorbed dose as long as the absorption of the emitted particle is 100 % localized in the organ.

Useful relations in the calculations are

$$n = A \cdot 1.44 \cdot T_{1/2\text{eff}} \quad (5)$$

$$1/T_{1/2\text{eff}} = 1/T_{1/2\text{phys}} + 1/T_{1/2\text{biol}} \quad (6)$$

#### EXTERNAL DOSIMETRY

Beta dose rate on a volume with an even radioactivity concentration.

$$dH/dt = 10^{-10} \cdot C \cdot f \cdot E_{\text{max}} \quad (7)$$

Beta dose rate from a point source

$$dH/dt = 10^{-11} \cdot A \cdot f \cdot d^2 \quad (8)$$

Gamma dose rate from a point source

$$dH/dt = \Gamma \cdot A / d^2 \quad (9)$$

Sv/h = Dose rate in Sv/h

$A$  = Radioactivity in Bq

$C$  = Radioactivity concentration in Bq/kg

$E_{\text{max}}$  = The maximum beta energy in MeV

$f$  = The number emitted beta per decay

$d$  = distance to the source in meter

**Table 1** Physical, biological and effective half-times for some radionuclides

Nuclide	$T_{1/2\text{phys}}$	$T_{1/2\text{biol}}$	$T_{1/2\text{eff}}$
$^3\text{H}$	12 a	10 d	10 d
$^{11}\text{C}$	20 min	10-40 d	20 min
$^{14}\text{C}$	5730 a	10-40 d	10-40 d
$^{90}\text{Sr}$	29 a	5 a	5a
$^{125}\text{I}$	60 d	80 d	35 d
$^{131}\text{I}$	8 d	80 d	7 d
$^{137}\text{Cs}$	30 a	100 d	100 d

**Table 2** Gamma constant,  $\Gamma$  for some radioactive nuclides,  $10^{-12} \text{ Sv} \cdot \text{h}^{-1} \cdot \text{Bq}^{-1} \cdot \text{m}^{-2}$

Nuclide	$\Gamma$	Nuclide	$\Gamma$
$^{22}\text{Na}$	0.32	$^{99\text{m}}\text{Tc}$	0.016
$^{24}\text{Na}$	0.47	$^{103}\text{Ru}$	0.090
$^{28}\text{Al}$	0.23	$^{110\text{m}}\text{Ag}$	0.38
$^{38}\text{Cl}$	0.19	$^{122}\text{Sb}$	0.064
$^{42}\text{K}$	0.035	$^{124}\text{Sb}$	0.026
$^{46}\text{Sc}$	0.29	$^{125}\text{I}$	0.037
$^{51}\text{Cr}$	0.0043	$^{131}\text{I}$	0.056
$^{54}\text{Mn}$	0.13	$^{134}\text{Cs}$	0.23
$^{56}\text{Mn}$	0.22	$^{137}\text{Cs}$	0.086

$^{82}\text{Br}$	0.039	$^{198}\text{Au}$	0.062
$^{86}\text{Rb}$	0.013	$^{201}\text{Tl}$	0.012
$^{95}\text{Zr}$	0.11	$^{203}\text{Hg}$	0.035
$^{99}\text{Mo}$	0.038	$^{226}\text{Ra}$	0.22

If the nuclide is not in the table this formula can be used to calculate the  $\Gamma$ -constant.

$$\Gamma = \Sigma \Gamma_i = 4.58 \cdot 10^{-14} * \Sigma E_i * f_i * \mu_{en}$$

$E_i$  is the gamma energy in MeV,  $f_i$  number of gamma emitted of this energy per decay,  $\mu_{en}$  is the energy absorption coefficient in  $m^{-1}$

### SOME IMPORTANT TABLES

**Table 3** Weighting factors for calculation of the effective dose equivalent.

Organ	Weighting factor, $W_T$
Gonads	0.25
Breast	0.15
Red marrow	0.12
Lung	0.12
Thyroid	0.03
Bone surface	0.03
Reminder	0.30

**Table 4** Density of some common materials

Material	Density (g/cm <sup>3</sup> )
Air	$1.3 \cdot 10^{-3}$
Paper	0.6
Wood	0.6
Plastics	1-1.2
Water	1.0
Tissue	1.0
Bone	2.7
Concrete	2.3
Glass	2.5
Rock	2.6
Granite	2.7
Alumina	2.7
Lead	11.3
Steel	7.8
Brass	8.5
Copper	8.9

**Table 5**  $W_R$ -values for some types of radiation

Type of radiation	$W_R$
X-ray, gamma	1
electrons, beta	1
protons, slow	10
protons, fast >10 MeV	1-2
neutrons, thermal	2.3
neutrons, fast	10-20
alpha, heavy ions	20

**Table 6** ALI values (Bq) for some common radionuclides. The ALI-values correspond to an effective dose equivalent of 50 mSv.

Nuclide	ALI	Nuclide	ALI	Nuclide	ALI
<sup>3</sup> H	$3 \cdot 10^9$	<sup>65</sup> Zn	$1 \cdot 10^7$	<sup>129</sup> I	$2 \cdot 10^5$
<sup>14</sup> C	$9 \cdot 10^7$	<sup>69m</sup> Zn	$2 \cdot 10^8$	<sup>130</sup> I	$1 \cdot 10^7$

**PHOTON ATTENUATION**

$$N = N_0 e^{-\mu \cdot x} \quad (10)$$

$N_0$  = incoming number of photons  
 $N$  = outgoing number of photons  
 $\mu$  = attenuation coefficient  
 $x$  = thickness of absorber

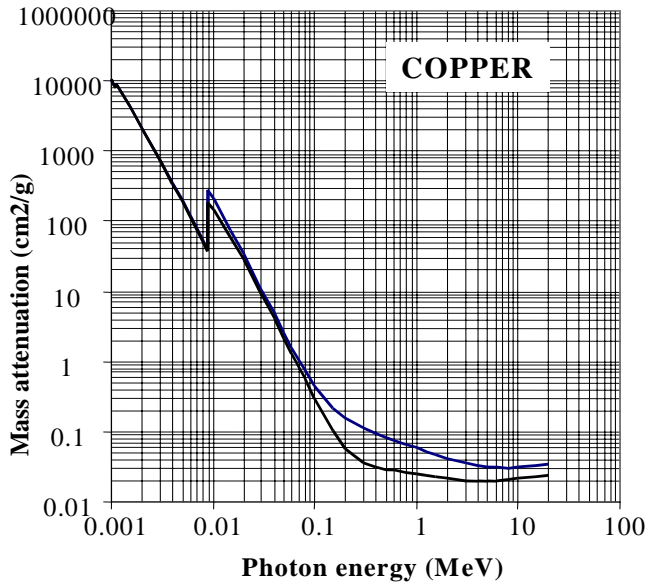

$$\text{HVL(Half Value Layer)} = \ln(2)/\mu = 0.693/\mu \quad (11)$$

**DIAGRAMS OF PHOTON ATTENUATION**

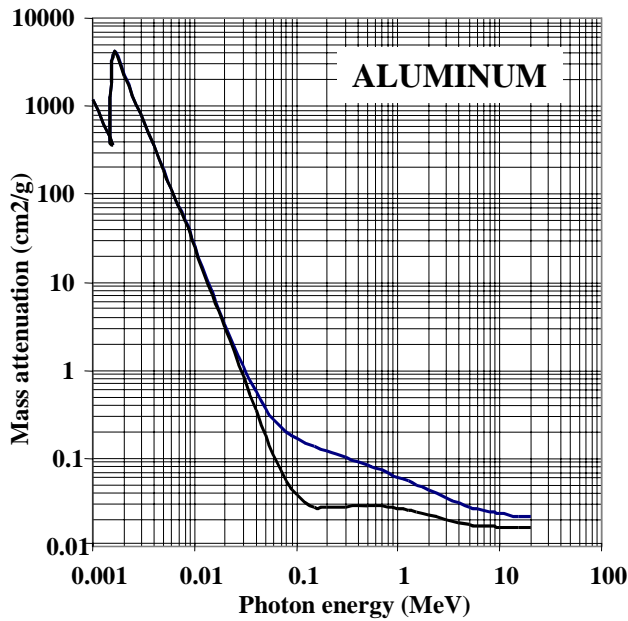

**Figure 1** Mass attenuation coefficient for water

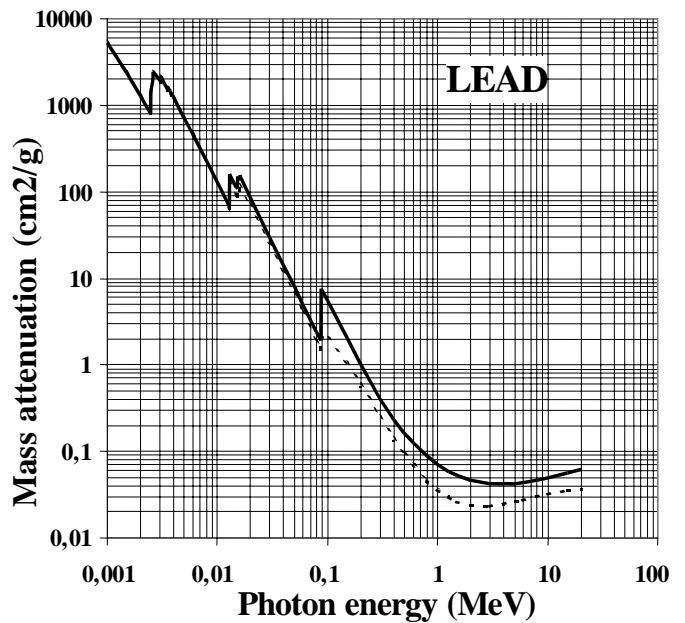

Dependant upon the information you want different attenuation coefficient can be used. In the gamma attenuation diagrams shown here the upper curve is the total mass attenuation coefficient while the lower curve is the mass energy absorption coefficient. Linear and mass attenuation coefficients are related by the material density,  $\rho$

**Figure 3** Mass attenuation coefficient for copper

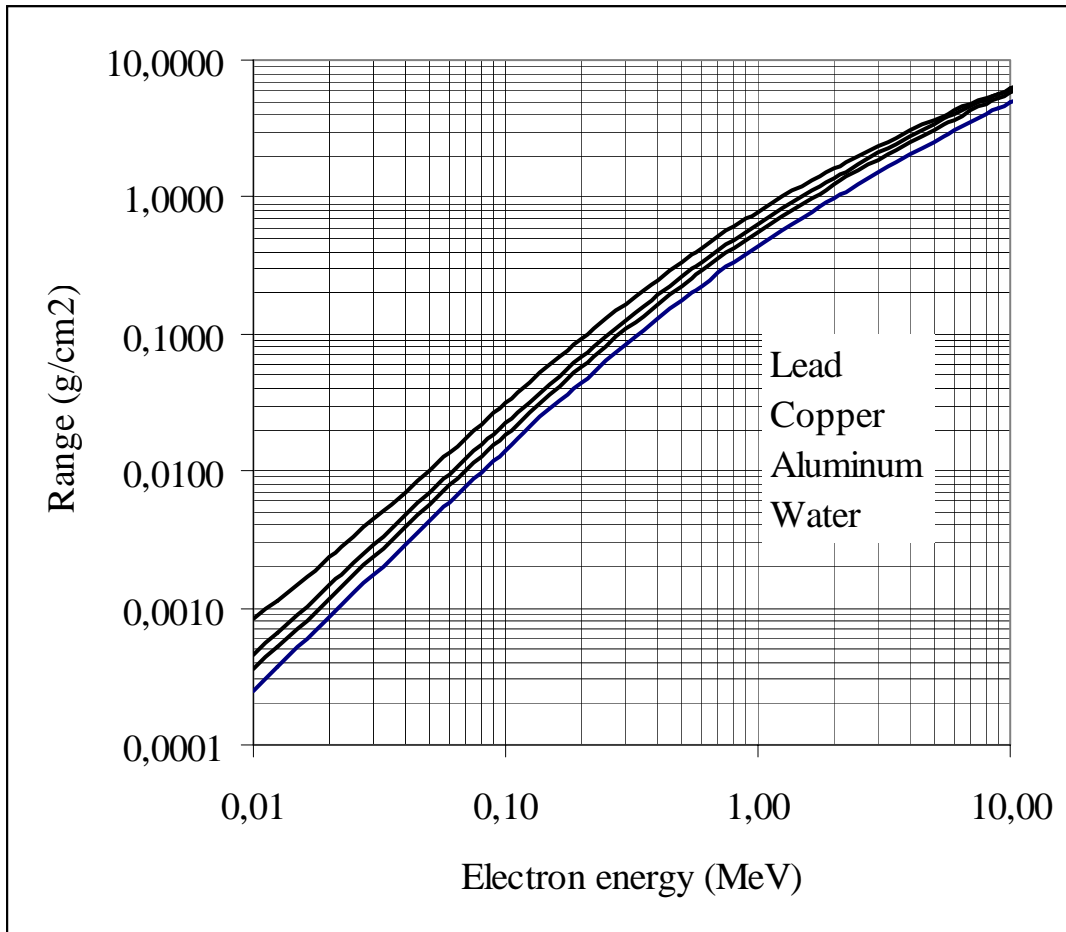

**Figure 2** Mass attenuation coefficient for aluminum.

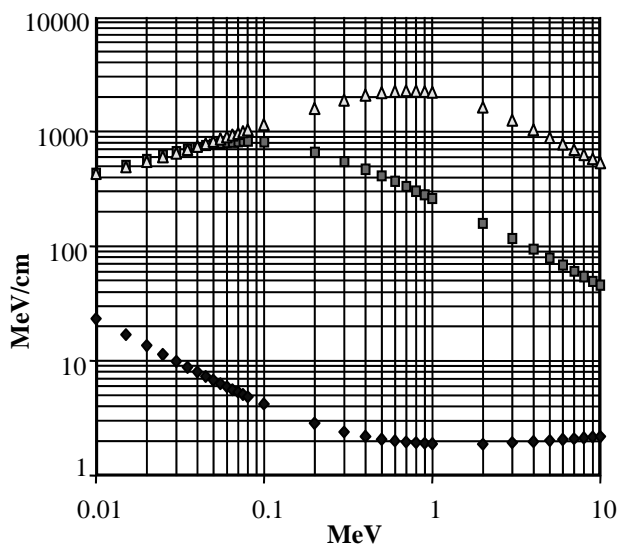

**Figure 4** Mass attenuation coefficient for lead.

**STOPPING POWER AND RANGE DIAGRAMS FOR CHARGE PARTICLES**

**Figure 5** Electron range in four materials. The curves are placed in the following order. Water: Bottom curve; Aluminum: Next; Copper: Next; Lead: Next, which also is the upper curve.

**Figure 6** Stopping power in water for electrons (lower curve), protons (middle curve and alpha (upper curve),

**Figure 7** Range in water for electrons (upper curve), protons (middle curve) and alpha (lower curve)
